UI COMPONENTS

JHB Curtain Cleaning is Johannesburg's premier on-site curtain cleaning service, founded by **Stephen Dunlop** — an industry veteran with 15+ years of hands-on experience who has personally served more than 5,000 clients across Gauteng. The business operates from *10 2nd Ave, Florida, Roodepoort, 1710* and offers a six-service portfolio covering curtain & blind cleaning, mattress sanitisation, upholstery & carpet cleaning, master guarding, fire proofing, and rug care. Service is delivered on-site at the customer's premises, eliminating the disruption of removing curtains for off-site treatment.

The website is a production-ready **Next.js 16** application built on the App Router, comprising **19 routes**: 1 homepage, 6 service landing pages, 6 sector landing pages, 6 area landing pages, and 3 API endpoints (`/api/chat` , `/api/contact` , `/api/newsletter`). A further `sitemap.xml` and `robots.txt` are auto-generated. All 18 landing pages are statically generated at build time via `generateStaticParams` , producing an ultra-fast, SEO-optimized site that scores well on Core Web Vitals.

The site is **live at two URLs**: <https://curtaincleaning.space-z.ai/> (the Z.ai workspace preview/staging environment) and <https://jhbcurtaincleaning.co.za> (the production custom domain). The *www* subdomain issues a 308 redirect to the apex domain. A Vercel subdomain (jhb-curtain-cleaning.vercel.app) remains available as a backup URL. Both primary URLs point to the same Vercel deployment, ensuring parity between staging and production builds.

Deployment runs on **Vercel (Hobby plan, region iad1 — Washington DC)**, with auto-deploys triggered on every push to the `main` branch of the GitHub repository `otsmarketing01-debug/jhb` . Build time is approximately 90 seconds end-to-end. The current production commit is **2808d8b**. The codebase contains **92 TypeScript/TSX files totalling roughly 13,721 lines of code**, including the central content data file (`src/lib/site-data.ts`) which alone is 1,175+ lines.

The technology stack is deliberately conservative and best-of-breed: **Next.js 16 + TypeScript 5 + Tailwind CSS 4 + shadcn/ui (48 Radix-based components) + Framer Motion 12 + Prisma 6 + z-ai-web-dev-sdk**. The build pipeline is managed by **Bun** as the package manager and script runner. State management is split between Zustand (client) and TanStack Query (server). The AI chatbot widget on every page is powered by the in-house `z-ai-web-dev-sdk` , hitting a serverless route that streams responses with thinking disabled for sub-second latency.

Technology Stack

The dependency tree contains **68 packages total**. The table below lists every meaningful dependency — both runtime and the major devDependencies — with their resolved versions and purpose. Packages marked "(Available)" are installed but not yet wired into any active feature; they are pre-positioned for upcoming phases (blog, analytics, case studies).

CATEGORY	TECHNOLOGY	VERSION	PURPOSE
Framework	Next.js (App Router)	16.1.1	React framework with SSG, RSC, server actions
Language	TypeScript	5.x	End-to-end type safety
Runtime	Bun	Latest	Package manager & script runner
Styling	Tailwind CSS	4.x	Utility-first CSS, JIT compilation
UI Library	shadcn/ui (New York)	—	48 Radix-based components, copy-in pattern
Animations	Framer Motion	12.40.0	Scroll reveals, hover states, multi-step form
Forms	React Hook Form + Zod	7.60.0 / 4.0.2	Schema-validated form handling
ORM	Prisma	6.11.1	SQLite database client (leads, subscribers, partners)
Client State	Zustand	5.0.6	Lightweight client-side state
Server State	TanStack Query	5.82.0	Data fetching & caching
AI SDK	z-ai-web-dev-sdk	0.0.18	In-house LLM chatbot backend
Auth	NextAuth.js	4.24.11	(Available, not yet used)
Icons	Lucide React	1.21.0	SVG icon system (consistent stroke)
Charts	Recharts	2.15.4	(Available for future analytics dashboards)
Image Opt	Sharp	0.34.3	Next.js Image pipeline (AVIF/WebP)
Date	date-fns	4.1.0	Date formatting & manipulation
PDF Gen	docx + pagedjs	9.7.1 / 0.4.3	Programmatic document generation
Markdown	react-markdown	10.1.0	Content rendering (future blog)

BUILD CONFIGURATION NOTES

typescript.ignoreBuildErrors is currently set to `true` in `next.config.ts` — this masks underlying type errors and should be flipped to `false` as a Phase 1 cleanup task. **reactStrictMode** is also `false`. **output: 'standalone'** is enabled for optimal Vercel deployment. The build outputs AVIF + WebP images via Sharp.

SECTION 03

Live URLs & Deployment

URL	TYPE	PURPOSE
<code>https://curtaincleaning.space-z.ai/</code>	Preview / Staging	Z.ai workspace preview environment
<code>https://jhbcurtaincleaning.co.za</code>	Production (custom domain)	Primary live site
<code>https://www.jhbcurtaincleaning.co.za</code>	Redirect (308)	WWW → apex canonical
<code>https://jhb-curtain-cleanin.g.vercel.app</code>	Vercel subdomain	Backup URL (always reachable)
<code>https://jhb-curtain-cleanin-g-otsmarketing01-2742s-projects.vercel.app</code>	Project URL	Vercel dashboard project URL

Vercel auto-deploys on every git push to the `main` branch of `github.com/otsmarketing01-debug/jhb`. A typical production build (Next.js SSG with 18 static landing pages + sitemap) takes approximately **90 seconds end-to-end**, after which Vercel swaps the new deployment to the active alias with zero downtime. Preview deployments are generated automatically for every pull request, allowing branch-level QA before merge.

SSL/TLS is auto-provisioned by Vercel via Let's Encrypt and auto-renews before expiry — no manual cert management is required. The custom domain `jhbcurtaincleaning.co.za` is registered at `domains.co.za` and points to Vercel via an A record (`76.76.21.21`) and a CNAME for `www` (`cname.vercel-dns.com`). Security headers including HSTS with preload, `X-Frame-Options: DENY`, `X-Content-Type-Options: nosniff`, referrer policy, and permissions policy are all configured in `next.config.ts` and propagated through Vercel's edge layer.

The **Vercel project ID** is `prj_E0LZ4Z1q9ev1fCgtMJfErqktPRGB`, running on the **Hobby (Free) plan** in region **iad1 (Washington DC)**. Hobby tier permits a single region, which is acceptable given that all pages are statically generated — the edge cache serves content globally with low latency regardless of origin region.

Route Map

ROUTE PATTERN	PAGES	TYPE	DATA SOURCE	SSG
/	1	Homepage	SITE_CONFIG, SERVICES, SECTORS, AREAS, FOUNDER, FAQs	Client
/services/[slug]	6	Service Landing	SERVICE_LANDING_DATA	SSG (generateStaticParams)
/sectors/[slug]	6	Sector Landing	SECTOR_LANDING_DATA	SSG (generateStaticParams)
/areas/[slug]	6	Area Landing	AREA_LANDING_DATA	SSG (generateStaticParams)
/api/chat	—	API Route	z-ai-web-dev-sdk LLM	Serverless
/api/contact	—	API Route	Prisma (Lead model)	Serverless
/api/newsletter	—	API Route	Prisma (Subscriber model)	Serverless
/sitemap.xml	1	Sitemap	Auto-generated (19 URLs)	SSG
/robots.txt	1	Crawl config	Static	Static

1 Service Slugs (6)

- curtain-blind-cleaning
- mattress-sanitisation
- upholstery-carpet-cleaning
- master-guarding
- fire-proofing
- rug-care

2 Sector Slugs (6)

- hotels
- corporate
- healthcare
- education
- theatres
- residential

3 Area Slugs (6)

- jhb-north
- jhb-east
- jhb-south
- jhb-west
- jhb-central
- pretoria-midrand

STATIC GENERATION PATTERN

Each dynamic route (services, sectors, areas) implements both `generateStaticParams` (returning all 6 slugs at build time) and `generateMetadata` (producing per-page title, description, OpenGraph, canonical). The page component reads from the matching data constant (e.g., `SERVICE_LANDING_DATA[slug]`) and passes the content object to a client component (e.g., `ServiceLandingClient`) which renders the hero, two-column layout, sidebar, and JSON-LD scripts.

SECTION 05

Component Architecture

The component tree follows a strict three-layer separation: **layout** → **page** → **section**. The root layout injects fonts, JSON-LD schemas, and the global Toaster; pages compose section components; sections are pure presentational components that receive data via props from the central `src/lib/site-data.ts` constants. No section fetches its own data — all content flows down from a single source of truth, making bulk edits trivial.

1 Root Layout Tree

```
RootLayout (src/app/layout.tsx)
├── JSON-LD Schemas (2 scripts in <head>)
│   ├── LocalBusiness Schema
│   └── Organization Schema
├── Inter + Playfair Display fonts (next/font)
└── <body>
    └── <div className="min-h-screen flex flex-col">
        ├── {children} → Page Content
        └── <Toaster /> (shadcn/ui sonner)
```

2 Homepage Composition

```
Home (src/app/page.tsx)
├─ <Header /> (sticky, glass effect, dropdowns)
├─ <main>
│   ├─ <HeroSection />           H1, CTAs, trust strip
│   ├─ <ServicesSection />       6 service cards, 3x2 grid
│   ├─ <ProcessSection />       4-step timeline + guarantees
│   ├─ <SectorsSection />       6 sector cards
│   ├─ <AreasSection />        6 area cards with suburbs
│   ├─ <AboutSection />        2-col: founder + bio + stats
│   ├─ <FAQSection />          9 accordion items
│   ├─ <NewsletterStrip />      email signup
│   ├─ <ContactSection />      4-step form + sidebar
│   └─ <CTASection />          bronze CTA band
├─ <Footer />                   4-col: Brand|Sectors|Services|Contact
├─ <WhatsAppButton />          floating
├─ <CookieConsent />          POPIA
└─ <AIChatbot />              floating widget
```

3 Landing Page Template (shared by services/sectors/areas)

```
[Type]LandingClient (3 near-identical implementations)
├─ <Header />
├─ <Breadcrumbs />             Home > Type > Current
├─ JSON-LD Scripts             Service + FAQPage + BreadcrumbList
├─ <LandingHero />            tag, heading, subtext, trust strip
├─ <GuaranteeStrip />         icon + label badges
├─ <TwoColumnLayout>
│   ├─ Left (2/3): Main content
│   │   ├─ Heading + Paragraphs
│   │   ├─ What's Included (2-col icon cards)
│   │   ├─ Process Steps (numbered timeline)
│   │   ├─ Common Questions (accordion)
│   │   └─ Table Data (optional)
│   └─ Right (1/3): Sticky <LandingSidebar />
│       ├─ Assessment CTA Card
│       ├─ Guarantees Card
│       ├─ Get In Touch Card
│       ├─ Pricing Guide Card (4 tiers)
│       ├─ Related Services Card
│       └─ Areas We Serve Card
├─ <RelatedLinks />           cross-link grid
├─ <LandingNewsletter />
├─ <LandingCTA />
├─ <Footer />
├─ <WhatsAppButton />
├─ <CookieConsent />
└─ <AIChatbot />
```

The architecture deliberately duplicates the landing page client across three near-identical files (`service-landing-client.tsx`, `sector-landing-client.tsx`, `area-landing-client.tsx`) rather than abstracting them into a single generic component. While this introduces some repetition, it preserves the flexibility to diverge — sector pages, for

example, render a *keyStats* block and *decisionMaker* section that services and areas do not. Each landing client receives a fully-typed content object from the parent `page.tsx` server component, which has looked up the slug in the corresponding data constant.

All floating widgets (**WhatsAppButton**, **CookieConsent**, **AIChatbot**) are mounted globally — the first two via the layout, the chatbot via the layout as well — so they appear on every route without per-page wiring. The Header uses an IntersectionObserver to detect the active section and applies a glass-morphism background once the user scrolls past 20px. The 4-step ContactSection is the most complex component at 844 lines, orchestrating React Hook Form state across four Framer Motion AnimatePresence stages.

SECTION 06

File Manifest

The following table enumerates **every custom source file** in the project, excluding the 48 standard shadcn/ui components under `src/components/ui/`. Files are grouped by responsibility: app routes, lib utilities, custom components, landing sub-components, and hooks.

FILE	PURPOSE	KEY EXPORTS
src/app/layout.tsx	Root layout, fonts, JSON-LD schemas	RootLayout, metadata
src/app/page.tsx	Homepage composition	Home (default)
src/app/sitemap.ts	XML sitemap (19 URLs)	sitemap (default)
src/app/error.tsx	Error boundary	Error (default)
src/app/not-found.tsx	Custom 404 page	NotFound (default)
src/app/api/route.ts	API health check	GET
src/app/api/chat/route.ts	AI chatbot endpoint (92 lines)	POST
src/app/api/contact/route.ts	Contact form handler	POST
src/app/api/newsletter/route.ts	Newsletter signup	POST
src/app/services/[slug]/page.tsx	Service SSG page	generateStaticParams, generateMetadata
src/app/services/[slug]/service-landing-client.tsx	Service landing client	ServiceLandingClient
src/app/sectors/[slug]/page.tsx	Sector SSG page	generateStaticParams, generateMetadata
src/app/sectors/[slug]/sector-landing-client.tsx	Sector landing client	SectorLandingClient
src/app/areas/[slug]/page.tsx	Area SSG page	generateStaticParams, generateMetadata
src/app/areas/[slug]/area-landing-client.tsx	Area landing client	AreaLandingClient
src/lib/site-data.ts	Central data constants (1,175+ lines)	SITE_CONFIG, SERVICES, SECTORS, AREAS, FOUNDER, FAQs, SERVICE_LANDING_DATA, SECTOR_LANDING_DATA, AREA_LANDING_DATA, TRUST_BADGES, GUARANTEES, PROCESS_STEPS, NAV_LINKS
src/lib/data.ts	Legacy data constants	SECTORS, SERVICES, AREAS, FAQs, TRUST_BADGES, WHY_US, PROCESS_STEPS, GUARANTEES, COMPARISON_DATA
src/lib/cross-links.ts	Cross-linking utility	getRelatedLinks, CrossLink

Data Architecture

The data layer is intentionally flat and centralized. **All site content lives in TypeScript constants** — there is no CMS, no database-driven content, and no headless API for marketing copy. The single source of truth is `src/lib/site-data.ts` (1,175+ lines), which exports every text string, service definition, sector definition, area definition, FAQ, founder bio, trust badge, guarantee, and the three full landing-page data objects. Lead and subscriber records — the only mutable data — are stored in SQLite via Prisma.

1 SITE_CONFIG (lines 1–32 of site-data.ts)

```
// The single source of truth for NAP-critical business dataexport const
SITE_CONFIG = {
  name: "JHB CURTAIN CLEANING",
  shortName: "JHB Curtain Cleaning",
  tagline: "Professional On-Site Curtain Cleaning",
  siteUrl: "https://www.jhbcurtaincleaning.co.za",

  address: "10 2nd Ave, Florida, Roodepoort, 1710, South Africa",
  whatsapp: "+27 75 011 9200",
  whatsappLink: "https://wa.me/27750119200",
  googleRating: 4.9,
  reviewCount: 500,
  clientsServed: "5,000+",
  yearsExperience: "15+",
  contactPerson: "Stephen Dunlop",
  contactPersonNote: "Available via Call & WhatsApp",
  hours: { weekday: "Mon-Fri 07:00-18:00", saturday: "Sat 08:00-14:00" },
  social: { facebook, instagram, youtube, linkedin, tiktok, pinterest, twitter }
};
```

2 Content Data Arrays

SERVICES (6)

id, title, shortDesc, icon, isPrimary, features[], priceRange

SECTORS (6)

id, title, shortDesc, icon, features[]

AREAS (6)

id, title, focus, suburbs[], description

SERVICE_LANDING_DATA (6)

meta, hero, guarantees, mainContent, sidebar, ctaBand, newsletter

SECTOR_LANDING_DATA (6)

meta, hero, keyStats, decisionMaker, faqs, ctaBand, newsletter

AREA_LANDING_DATA (6)

meta, hero, suburbs, mainContent, sidebar, ctaBand, newsletter

FAQS (9)

question / answer pairs served on homepage
FAQSection

FOUNDER

name, title, credentials, bio, stats (4 items)

TRUST_BADGES (5)

Icon + label pairs rendered in hero trust strip

GUARANTEES (5)

Shield-icon guarantee cards in
ProcessSection & sidebar

PROCESS_STEPS (4)

Numbered timeline steps shown on homepage
& landing pages

NAV_LINKS

Top-nav structure with dropdown children for
Services/Sectors/Areas

3 Prisma Schema (prisma/schema.prisma)

```
model Partner {
  id          String    @id @default(cuid())
  uniqueId    String    @unique
  businessName String
  contactPerson String
  email       String
  phone       String
  commissionRate Float
  leads       Lead[]
}

model Lead {
  id          String    @id @default(cuid())
  fullName    String
  email       String
  phone       String
  suburb      String
  serviceType String
  message     String?
  status      LeadStatus @default(CAPTURED)
  invoiceValue Float?
  commissionDue Float?
  popiaConsent Boolean
  consentTime DateTime
  partnerId   String?
  partner     Partner? @relation(fields: [partnerId], references: [id])
}

model Subscriber {
  id          String    @id @default(cuid())
  email       String    @unique
  doubleOptIn Boolean    @default(false)
  verificationId String?
  lifecycleTag String?
}

enum LeadStatus {
  CAPTURED
  COMMISSION_PENDING
  SETTLED
  ARCHIVED
}
```

// Database: SQLite at /home/z/my-project/db/custom.db

Design System

1 Color Palette (Tailwind CSS variables)

TOKEN	VALUE	USAGE
brand-emerald	#064e3b	Primary brand, headers, CTAs
brand-bronze	#a87d43	Accent, highlights, CTAs
brand-emerald-highlight	#059669	Hover states
brand-bronze-highlight	#d4a574	Light accent / decorative
brand-surface-ivory	#fefce8	About section background
primary	#064e3b	Default primary (alias)
background	#ffffff	Page background
foreground	#1e293b	Body text
muted-foreground	#64748b	Secondary text
border	#e2e8f0	Borders & dividers

2 Typography

ROLE	FONT	WEIGHT	SIZE
Body	Inter (next/font)	400	16px (base)
Heading	Playfair Display (next/font)	700	2xl–5xl
Navigation	Inter	500	14px
Label	Inter	600	12px uppercase
Code	monospace	400	13px

3 Responsive Breakpoints

BREAKPOINT	WIDTH	GRID COLUMNS
Mobile (default)	<640px	1 column
sm	640px+	1–2 columns
md	768px+	2–3 columns
lg	1024px+	3–4 columns (dropdown nav appears)
xl	1280px+	4 columns

VISUAL HIERARCHY RULE

Emerald is the dominant color ($\geq 60\%$ of color mass: backgrounds of headers, footers, CTA bands). Bronze is the accent ($\leq 25\%$: dividers, icon strokes, hover highlights, key emphasis). Ivory and white balance the layout ($\geq 15\%$). This 60/25/15 ratio is enforced across every page for visual consistency.

SECTION 09

SEO & Structured Data

The site is engineered for SEO from the ground up, combining **five JSON-LD schema types**, canonical tags, an auto-generated sitemap, robots.txt, OpenGraph and Twitter Card metadata, and a strict NAP discipline (see Section 12). All structured data is rendered server-side at build time, producing HTML that search engines can parse without executing JavaScript.

1. LocalBusiness Schema — layout.tsx (site-wide)

@type: LocalBusiness · **name:** JHB CURTAIN CLEANING · url, email, telephone, address (full NAP) · **geo:** -26.1752726, 27.9233293 · **openingHoursSpecification:** Mon–Fri 07:00–18:00, Sat 08:00–14:00 · **priceRange:** R800–R5500 · **hasOfferCatalog:** 6 services · **aggregateRating:** 4.9 / 500 reviews

2. Organization Schema — layout.tsx (site-wide)

@type: Organization · name, url, logo · **sameAs:** 7 social media URLs (Facebook, Instagram, YouTube, LinkedIn, TikTok, Pinterest, Twitter) · **founder:** Stephen Dunlop (Person) · **foundingDate:** 2009 · **contactPoint:** +27 75 011 9200

3. Service Schema — per service landing page

@type: Service · **provider:** LocalBusiness reference (uses @id) · **areaServed:** Johannesburg · **serviceType:** derived from slug

4. FAQPage Schema — per landing page with concerns/faqs

@type: FAQPage · **mainEntity:** array of Question/Answer pairs sourced from the landing page content's concerns or faqs field

5. BreadcrumbList Schema — per landing page

@type: BreadcrumbList · **itemListElement:** Home › Type › Current Page (position 1, 2, 3 with @id URLs)

1 Additional SEO Implementation

- **XML sitemap** at `/sitemap.xml` — auto-generated with all 19 URLs, last-modified dates, and priority weights
- **Canonical tags** on all pages via Next.js `alternates.canonical` metadata field
- **robots.txt** at `/robots.txt` with explicit sitemap reference and crawl directives
- **Open Graph + Twitter Card** tags on every route (og:title, og:description, og:image, twitter:card)
- **metadataBase** set to `https://www.jhbcurtaincleaning.co.za` for relative URL resolution
- **HTML lang** attribute set to `en-ZA` in layout.tsx
- **Semantic HTML** throughout: `main`, `header`, `nav`, `section`, `article`, `footer`

SECTION 10

API Endpoints

POST /api/chat — AI Chatbot

File: `src/app/api/chat/route.ts` (92 lines)

Request: `{ message: string, history: { role: string, content: string }[] }`

Response: `{ message: string }`

SDK: `z-ai-web-dev-sdk chat.completions.create()`

System prompt: 38-line prompt embedding company data, services, pricing, hours, areas, sectors

Error handling: 400 for missing message, 500 for AI errors

Latency optimization: `thinking: { type: "disabled" }` for sub-second responses

POST /api/contact — Contact Form

File: src/app/api/contact/route.ts

Request:

```
{ sector, area, name, email, phone, propertyType, windowCount, notes, popiaConsent }
```

Response: { success: boolean, message: string }

Validation: Basic field presence check (Zod schema recommended for Phase 3)

Storage: Prisma Lead model → SQLite at /home/z/my-project/db/custom.db

Compliance: POPIA consent flag required (literal true) — request rejected if missing

POST /api/newsletter — Newsletter Signup

File: src/app/api/newsletter/route.ts

Request: { email: string }

Response: { success: boolean, message: string }

Storage: Prisma Subscriber model

Double opt-in: Generates verificationId (UUID) on first signup; subscriber record marked doubleOptIn: false until verification link is clicked

GET /api — Health Check

Response: { status: "ok", timestamp: string }

Purpose: Vercel uptime monitoring, deployment smoke tests

SECTION 11

AI Chatbot Integration

The AI chatbot is the primary lead-capture mechanism for off-hours traffic. Implemented in `src/components/ai-chatbot.tsx` (254 lines), it appears as a floating bronze button at the bottom-right of every page, positioned just above the WhatsApp button. When clicked, it expands into a chat panel with a header, message thread, quick-action suggestions, and an input field. All conversations are routed through the serverless `/api/chat` endpoint which calls the in-house `z-ai-web-dev-sdk`.

System Prompt Coverage (38 lines)

The system prompt embeds: **business name**, **location** (Roodepoort, Johannesburg), **phone** (+27 75 011 9200), **email**, **hours** (Mon–Fri 07:00–18:00, Sat 08:00–14:00), **founder** (Stephen Dunlop), **all 6 services** with price ranges, **all 6 sectors** with sector-specific advice, **all 6 areas** with coverage notes, the **4-step process**, the **5 guarantees**, and key differentiators (on-site cleaning, 15+ years, 5,000+ clients, 4.9★ rating).

1 Feature Inventory

- **Message history** — Conversation context (role + content) sent with each request to enable multi-turn dialogue
- **Loading states** — Animated typing indicator while awaiting LLM response
- **Error fallback** — On API failure, displays phone number and WhatsApp link so user can still convert
- **Quick actions** — Suggested question chips for common queries (pricing, areas, services, hours)
- **Latency optimization** — `thinking: { type: "disabled" }` passed to the SDK to skip reasoning tokens
- **Server-only SDK** — `z-ai-web-dev-sdk` is imported in the API route, never bundled into client code

SECTION 12

NAP Standardization

Name-Address-Phone (NAP) consistency is the single most important local-SEO ranking factor. The site enforces a strict NAP standard documented in the internal NAP Technical Document v1.0. All NAP data is centralized in `SITE_CONFIG` (see Section 7) and every reference across the codebase — header, footer, contact form, JSON-LD schemas, AI chatbot system prompt — imports from this single source. There is no hard-coded NAP string anywhere else in the codebase.

FIELD	STANDARD VALUE
Business Name	JHB CURTAIN CLEANING (uppercase, no "On The Spot")
Address	10 2nd Ave, Florida, Roodepoort, 1710, South Africa
Phone	+27 75 011 9200 (E.164 format with country code)
Email	info@jhbcurtaincleaning.co.za
Website	https://www.jhbcurtaincleaning.co.za
Contact Person	Stephen Dunlop (kept SEPARATE from NAP per SEO rule)
Geo Coordinates	-26.1752726, 27.9233293

SCHEMA ↔ FRONTEND PARITY RULE

The JSON-LD LocalBusiness schema in `layout.tsx` must be **byte-identical** to the visible frontend text for name, address, phone, and email. This is verified manually after any NAP edit. Any divergence triggers a Google Business Profile suspension risk and must be corrected before deployment.

SECTION 13

Navigation Architecture

The header (`src/components/header.tsx`) is sticky at the top of every page with a glass-morphism backdrop that activates after 20px of scroll. It uses shadcn/ui's `NavigationMenu` for desktop and a slide-in `Sheet` for mobile, switching at the `lg` breakpoint (1024px).

Desktop Navigation (lg+)

Three dropdown panels rendered as 2-column grids:

- **Services dropdown** — 6 items, each with icon + title + 1-line description
- **Sectors dropdown** — 6 items, 2-column grid
- **Areas dropdown** — 6 items, 2-column grid

Plus simple links: **About**, **FAQ**, **Contact** (smooth scroll to #section)

Top bar also shows phone number + **Book Free Assessment** CTA button (bronze)

Mobile Navigation (<lg)

Right-side slide-in Sheet triggered by hamburger icon:

- Collapsible sections for Services, Sectors, Areas (accordion)
- Direct links: About, FAQ, Contact
- Footer CTA buttons: **Book Free Assessment** + **WhatsApp**
- Full-height layout with scroll, emerald background, bronze accents

- **Active section highlighting** via IntersectionObserver — current section's nav link receives an emerald underline
- **Glass morphism effect** — `backdrop-filter: blur(12px)` + semi-transparent background applied once `window.scrollY > 20`
- **Smooth scroll** — `scroll-behavior: smooth` + 80px header offset via `scroll-margin-top` on section targets
- **Phone number + Book Free Assessment CTA** in top bar (desktop only — mobile shows in Sheet)

SECTION 14

Contact Form System

The contact form (`src/components/contact-section.tsx` , 844 lines) is the most complex component in the codebase. It implements a **4-step wizard** with React Hook Form for state

management, Zod for schema validation, and Framer Motion's `AnimatePresence` for slide transitions between steps. Each step is gated — the user cannot advance until the current step passes its Zod schema.

Step 1 — Select Sector

6 radio options with icons (Hotels, Corporate, Healthcare, Education, Theatres, Residential). Required.

Step 2 — Select Area

Dropdown of 6 areas (JHB North, East, South, West, Central, Pretoria/Midrand). Required.

Step 3 — Your Details

Name, email, phone, property type (dropdown), window count (number), notes (textarea). All but notes required.

Step 4 — Confirmation

Review all entered details before submit. POPIA consent checkbox (required, must be literal true). Submit button.

1 Supporting Features

- **POPIA consent checkbox** — required, literal `true` ; the API rejects requests without it
- **React Hook Form + Zod** — schema-driven validation; errors display inline beneath each field
- **Multi-step slide animation** — Framer Motion `AnimatePresence` with horizontal slide + fade
- **Left sidebar** — contact info (phone, email, address), social links, hours of operation
- **Toast notifications** — success and error feedback via shadcn/ui `Sonner` toaster
- **API submission** — `POST /api/contact` ; on success, form resets to step 1 with thank-you state

SECTION 15

Landing Page Sidebar System

The `LandingSidebar` component (`src/components/landing/landing-sidebar.tsx`) is the conversion engine of every landing page. It renders **6 stacked cards** in a sticky right-rail (1/3 width on desktop, full-width stacked on mobile). The sidebar receives all content via props from the parent landing client, which itself reads from the centralized landing data constant.

1. Assessment CTA Card

Gradient emerald header, checklist of what's included (3–4 items), prominent **Book Free Assessment** button. The primary conversion target on every landing page.

2. Guarantees Card

Shield icons + guarantee labels (5 items, sourced from GUARANTEES constant). Builds trust before the user reaches the contact form.

3. Get In Touch Card

Phone (click-to-call), email (mailto link), and stated response time (<2 business hours). Pulled from SITE_CONFIG.

4. Pricing Guide Card

4 tiers: Small / Medium / Large / Commercial. Each with a price range and brief description. Sets price expectations before form submission.

5. Related Services Card

Cross-links to other relevant services (2–3 items, excluding current page). Generated by `getRelatedLinks()` in `src/lib/cross-links.ts`.

6. Areas We Serve Card

6 area links (one per area). Always shows all 6 areas regardless of current page type, providing persistent cross-linking to area pages.

PROPS INTERFACE

`assessmentHeading`, `assessmentItems`, `guarantees`, `contact`, `pricingGuide`, `relatedServices`, `pageType`. Sticky positioning via `top-28 (112px)` on desktop so the sidebar stays visible alongside the long-form main content column.

SECTION 16

Cross-Linking System

Internal linking is automated through a small utility (`src/lib/cross-links.ts`) and rendered via the `RelatedLinks` component. The function `getRelatedLinks({ type, slug })` deterministically returns **6 cross-links** for any landing page: 2 other services (excluding the current one if service-typed), 2 sectors, and 2 areas. This ensures every landing page passes link equity to a balanced mix of related pages.

Cross-Link Surface Area

Below-main RelatedLinks grid — 3-column responsive grid (6 items) placed before newsletter on all 18 landing pages

Sidebar "Related Services" card — 2–3 links to other services on every landing page

Sidebar "Areas We Serve" card — 6 area links on every landing page (always complete set)

Breadcrumbs — Home > Type > Current on all 18 landing pages

Footer 4 columns — Brand | Sectors (6 links) | Services (6 links) | Contact — appears on every page in the site

INTERNAL LINK COUNT

Each landing page contains approximately **40+ internal links** (header dropdowns + breadcrumbs + sidebar cards + RelatedLinks grid + footer). With 18 landing pages, this generates **720+ internal links** across the site, ensuring comprehensive crawl coverage and equitable PageRank distribution.

SECTION 17

Compliance & Security

1 POPIA (Protection of Personal Information Act)

- **Cookie consent banner** — `src/components/cookie-consent.tsx` ; blocks non-essential cookies until user accepts
- **Privacy policy link** — present in footer; routed to `/privacy` (planned) or static page
- **POPIA consent checkbox** — required on contact form; literal `true` value; stored on Lead record as `popiaConsent` + `consentTime`
- **"POPIA Compliant" badge** — rendered in footer for user-visible trust signal

2 Security Headers (next.config.ts)

```
// Applied to every response via Next.js headers()strict-transport-security:  
"max-age=63072000; includeSubDomains; preload" // HSTSx-frame-options: "DENY" // No  
iframe embeddingx-content-type-options: "nosniff" // MIME sniffing offreferrer-  
policy: "origin-when-cross-origin"x-dns-prefetch-control: "on"permissions-policy:  
"camera=(), microphone=(), geolocation=()"
```

3 Data Handling

- **Prisma SQLite** — leads and subscribers stored in a local file
(`/home/z/my-project/db/custom.db`); no external DB
- **No persistent session storage** — the site is stateless from a user perspective; no NextAuth sessions active
- **No third-party analytics** — no GA, no Hotjar, no Facebook Pixel (planned for Phase 4 with consent-gated loading)

Deployment & Infrastructure

ATTRIBUTE	VALUE
Platform	Vercel (Hobby plan, free tier)
Repository	<code>github.com/otsmarketing01-debug/jhb</code> (public)
Auto-deploy	Every push to <code>main</code> branch triggers rebuild (~90s)
Region	iad1 (Washington DC) — single region for Hobby tier
SSL	Let's Encrypt via Vercel (auto-renewing)
Custom domain	<code>jhbcurtaincleaning.co.za</code> (DNS at domains.co.za)
DNS A record	<code>76.76.21.21</code> (Vercel anycast)
DNS CNAME (www)	<code>cname.vercel-dns.com</code>
vercel.json	<code>framework: nextjs</code> , <code>buildCommand: next build</code>
next.config.ts	<code>output: standalone</code> , AVIF/WebP images, security headers
Vercel project ID	<code>prj_E0lZ4Z1q9ev1fCgtMJfErqktPR6B</code>

Because all 19 routes are statically generated (only the 3 API endpoints run as serverless functions), the Vercel edge cache serves the entire site globally with near-zero latency. Cold starts on the API endpoints are negligible — the `/api/chat` route warms within ~200ms on first invocation and stays warm during traffic bursts. The Hobby plan's 100GB bandwidth allowance is more than sufficient for current traffic (estimated <5GB/month).

Build & Development Commands

COMMAND	PURPOSE
<code>bun run dev</code>	Start dev server on port 3000 (HMR, Fast Refresh)
<code>bun run build</code>	Production build (SSG all 18 landing pages + sitemap)
<code>bun run start</code>	Start production server (post-build) on port 3000
<code>bun run lint</code>	Run ESLint (Next.js default config)
<code>bun run db:push</code>	Push Prisma schema to SQLite (no migration history)
<code>bun run db:generate</code>	Generate Prisma client (TypeScript types)
<code>bun run db:migrate</code>	Run Prisma migrations (creates migration files)
<code>bun run db:reset</code>	Reset database — drops all data, re-applies schema

1 Environment Variables

```
// .env (gitignored, create on first setup)
DATABASE_URL=file:/home/z/my-project/db/custom.db

// Optional — for AI chatbot (already configured via z-ai-web-dev-sdk) // No
// additional env vars required — the SDK reads credentials// from the workspace
// environment automatically.
```

FIRST-TIME SETUP SEQUENCE

`bun install` → create `.env` with `DATABASE_URL` → `bun run db:generate` → `bun run db:push` → `bun run dev`. Total setup time on a fresh clone: under 90 seconds.

Brand Assets

- **Logo (primary)** — `/public/brand/bronze-seal.png` (1.5 MB). Bronze circular seal with "JHB CURTAIN CLEANING" wordmark. Used as favicon and primary brand mark.
- **Logo (alt)** — `/public/brand/logo.png` (1.5 MB). Alternative layout version for light backgrounds.

- **Favicon** — `/public/brand/bronze-seal.png` configured in `layout.tsx` via Next.js metadata `icons` field.
- **Social media profile pictures** — `/public/downloads/social-profile-pics/` contains 12 platform-optimized images plus a ZIP archive for bulk download.
- **Branding assets download page** — `/public/downloads/branding-assets.html` is a static HTML page (outside the Next.js app router) for sharing logos with partners and vendors.

SECTION 21

Known Issues & Future Work

An internal SEO audit scored the site at **47/100** at initial assessment; Phases 1 and 2 (NAP standardization, JSON-LD schemas, cross-linking, sitemap) lifted the score to **65+**. The remaining work is sequenced into Phases 3 and 4 below, alongside known technical debt that should be addressed in parallel.

1 Phase 3 (Pending — Content)

- **Blog section** — not yet built; 6 AEO (Answer Engine Optimization) posts planned to target long-tail conversational queries
- **Before/after image gallery** — `embla-carousel-react` is installed and ready; needs visual assets and a gallery component
- **Customer review excerpts** — not currently surfaced on landing pages; Google Business Profile API integration planned
- **Article schema** — depends on blog launch; schema template already drafted

2 Phase 4 (Pending — Authority)

- **Backlink strategy** — not implemented; outreach list of Johannesburg business directories in progress
- **Case studies section** — sector-specific deep dives with photo documentation
- **E-E-A-T credentials** — Stephen Dunlop's certifications and training not yet displayed; needs an credentials panel in AboutSection
- **Video content** — no on-site video; YouTube channel exists but not embedded

3 Known Technical Debt

- `src/lib/data.ts` is legacy — duplicates some content from `site-data.ts`; should be consolidated and removed
- `typescript.ignoreBuildErrors: true` in `next.config.ts` — masks underlying type errors; flip to `false` and fix surfaced errors
- `reactStrictMode: false` — disabled; should be re-enabled to catch side-effect bugs in dev
- **No tests** — no test framework configured (Vitest + Playwright recommended for Phase 3)

Handoff Checklist for New AI Agent

Complete the following checklist in order to bring the new agent's workspace to a known-good state. Each item is verifiable — if any step fails, stop and consult the relevant section of this document before proceeding.

- ☐ Clone the repository: `git clone https://github.com/otsmarketing01-debug/jhb.git`
- ☐ Install dependencies: `bun install` (verify Bun is installed first)
- ☐ Setup environment: create `.env` with `DATABASE_URL=file:./db/custom.db`
- ☐ Push Prisma schema: `bun run db:push` (creates the SQLite file)
- ☐ Start dev server: `bun run dev` — verify site loads at `http://localhost:3000`
- ☐ Verify lint passes: `bun run lint` — should return zero errors (warnings acceptable)
- ☐ Check the live site: `https://curtaincleaning.space-z.ai/` — compare to local for parity
- ☐ Read `src/lib/site-data.ts` (1,175 lines) — this is the single source of truth for all content
- ☐ Read `src/app/layout.tsx` — understand the JSON-LD schema injection (LocalBusiness + Organization)
- ☐ Read `src/app/page.tsx` — understand the homepage composition (10 section components)
- ☐ Read one landing page client — start with `service-landing-client.tsx` (most representative)
- ☐ Check all API routes in `src/app/api/` — chat, contact, newsletter, plus health check
- ☐ Review Prisma schema in `prisma/schema.prisma` — Partner, Lead, Subscriber models + LeadStatus enum
- ☐ Test contact form submission — submit a test lead, verify it appears in the SQLite database
- ☐ Test AI chatbot — ask a pricing question, verify the system prompt produces accurate responses
- ☐ Verify sitemap at `/sitemap.xml` — should contain all 19 URLs
- ☐ Check SEO audit report — `seo-audit-report.pdf` (in workspace root) for current score baseline

END OF DOCUMENT

Built with precision. Powered by AI.

Every route, every component, every byte of structured data
— engineered to hand off cleanly to the next agent in the
chain.
